Nay Htet Khant

FULL STACK DEVELOPER

Hangdong, Chiang Mai, Thailand
nayhtetkhant.dev@gmail.com
+66822736118
https://github.com/nayhtetkhant

Expected salary: MMK 400,000 - 700,000 / month

SUMMARY

Software Engineer with full-stack developer experience and a keen interest in DevOps and backend technologies. Knowledgeable on MVC design pattern based on current development practices. Continuously learning about AWS and CI/CD pipeline.

SKILLS

Frontend	HTML, CSS, Tailwind CSS, Shadcn
Full-Stack JavaScript	Typescript, Node.js, Alpine.js, React, Next.js, TanStack, Zustand
Backend (PHP)	PHP, Laravel, Reverb
Database	MySQL, PostgreSQL, Redis
DevOps & Tools	Docker, Caddy, Nginx, Git, Linux

EDUCATION

High School Graduated — 2024

CS50 | HarvardX (edx) — In Progress

PROJECTS

Real time Group Chat and Video conferencing app

Laravel, Next.js, Docker, Caddy, Reverb, LiveKit, TanStack Query

- Created a full-stack real-time communication app for multi-users group chat and video conferencing.
- Used LiveKit (SFU architecture) rather than P2P mesh because this approach saves on client bandwidth and guarantees the stability of video streams.
- Handled real-time messaging using Laravel Reverb (WebSockets) and optimized chat history loading with cursor pagination for smooth infinite scrolling.
- Managed the server and client states using TanStack Query and Zustand, respectively.
- Containerized the whole stack via Docker and set up Caddy as the reverse proxy with local SSL and nip.io routing for testing purposes within the whole local network.

Custom PHP MVC Framework

`PHP (OOP)` `PDO` `MySQL` `Composer`

- Developed a custom lightweight MVC framework from scratch to gain thorough knowledge about modern frameworks' inner workings and the use of design patterns and OOP concepts.
- Implemented an IoC / Service Container using PHP's ReflectionClass to support automatic Dependency Injection (DI) and method type-hinting, inspired by Laravel.
- Developed my own ORM-based database layer that uses PDO to perform secure and object-oriented database operations and prevent SQL injections in MySQL.
- Implemented modular core components including PSR-4 autoloading, custom routing, environment configuration (.env loader), and base Model-View-Controller classes.

Real-Time Communication (RTC) Proof of Concept

`Next.js` `WebRTC API` `Pusher (WebSockets)` `STUN`

- Built a peer-to-peer real-time communication proof of concept to deeply study browser-level WebRTC internals and bidirectional signaling protocols.
- Implemented Pusher Channels for WebSocket signaling, handling real-time peer discovery, channel subscriptions, and custom event dispatching.
- Integrated the native browser WebRTC API from scratch to manage peer connection handshakes, including SDP Offer/Answer exchange, ICE candidate gathering, and STUN server negotiation.

User Management System

`PHP` `MySQL` `PDO` `Alpine.js` `JavaScript` `HTML/CSS`

- Built an simple user management web application featuring complete CRUD operations and user authentication.
- Designed the back-end with clean architecture/SOLID design pattern to separate the business logic from the database to provide a modular RESTful API using PHP.
- Implemented raw PDO prepared statements without an ORM to master safe manual SQL querying and prevent SQL injection vulnerabilities.
- Designed a responsive front-end application with HTML/CSS and Alpine.js.
